

iBoss Desktop Monitor Control Record (DMCR)

The iBoss™ Enterprises' Automatic DMCR (Desktop Monitor/Control/Record) feature, will allow you to monitor, record, and control users desktops automatically on thresholds.

DMCR feature allows network administrators to properly identify Internet Use Policy violations by automatically recording the desktop of a potential violator. When a predefined threshold is crossed, the DMCR kicks in. It starts recoding the desktop and stores it in the violation logs for easy playback and exporting. This removes the potential of misidentifying violators due to unintentional access to restricted sites and increases productivity while reducing liability.

Benefits:

Threshold Based – Recordings can be set to trigger based on administrator defined thresholds

Review Violations – Properly identify violations to remove uncertainty introduced by accidental violations

Email Recordings – Allow to send recordings to third parties for review (i.e. HR, Site Admins)

Flexible Policy – Set recording by groups (AD, Edirectory, Subnet)

Real Time View – Provides insight on current user activity
